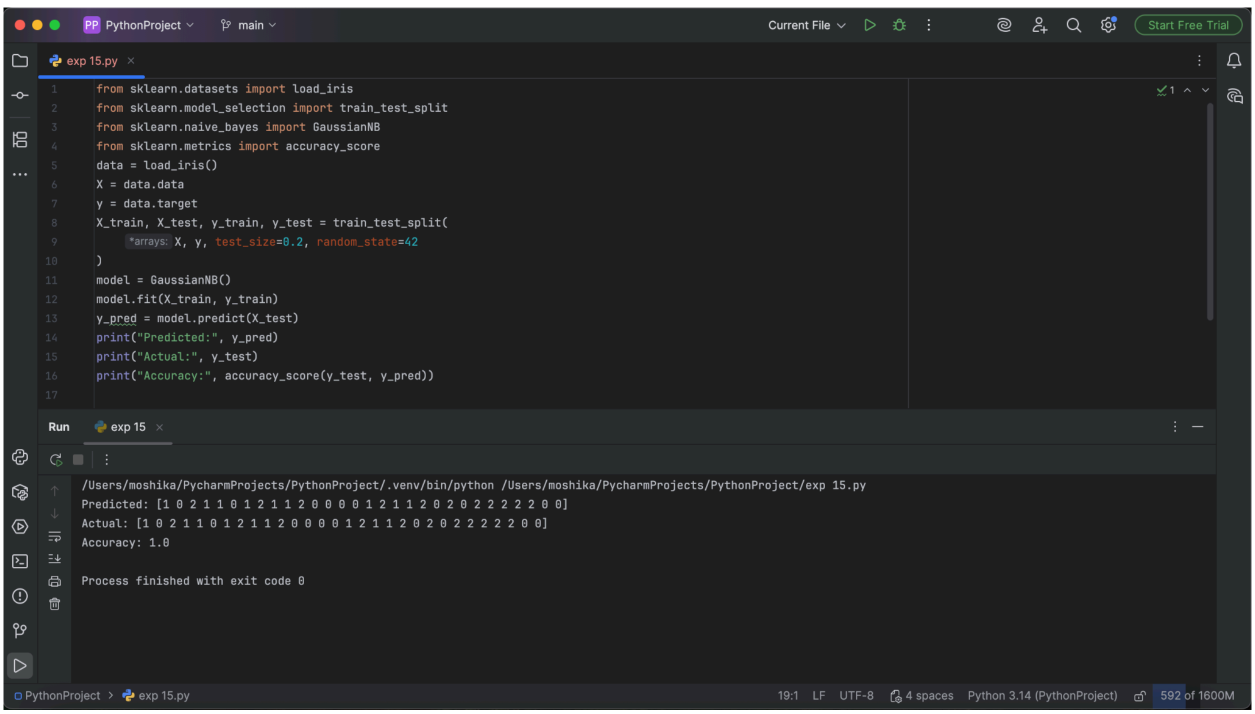
EXPERIMENT - 15

Aim: To classify Iris flowers into different species using the Naive Bayes classifier.

Procedure:

1. Load the Iris dataset.
2. Separate features and target labels.
3. Split the dataset into training and testing data.
4. Create a Naive Bayes classifier.
5. Train the classifier using training data.
6. Predict the classes for test data.
7. Calculate the accuracy.
8. Display the classification results.

Output:



Result: The Naive Bayes classifier successfully classified the Iris flowers into their respective species.
